

Accuracy Without Interference

Zero-Drift Amplifier Portfolio Maximizes Precision and Reliability

Build industry-leading precision into your high-accuracy applications with Microchip's portfolio of zero-drift operational amplifiers. Our ultra-low drift architecture provides reliable, accurate measurements across a wide range of conditions and is ideally suited for high-performance products with a long lifecycle.

We've reduced unwanted interference in harsh, unpredictable environments with on-chip EMI filters and enabled accuracy across extreme temperature ranges with offset drift as low as $15 \text{ nV}/^{\circ}\text{C}$. By continually self-correcting through auto-zeroing and chopper-stabilized technologies, our zero-drift amplifiers measure small signals with less error and without the need to implement factory calibrations or other error compensation techniques. We've additionally addressed the need for flexibility in space-constrained designs with several small package options.

With Microchip's growing portfolio of more than 13 unique zero-drift op amp families, we are sure to have the right solution for your design, whether you need low-power, high-speed or multiple-channel options. Discover your ideal precision measurement solution today.
