

How Remanufacturing Can Offer Brighter Future

Compared with manufacturing, remanufacturing (different from recycling) uses as little as ten per cent energy and raw materials, while lowering carbon-dioxide emissions by more than eighty per cent

Vinayak Ramachandra Adkoli is BE in industrial production. He has been a lecturer in mechanical department for ten years, in three different polytechnics. He is also a freelance writer and cartoonist

In 1991, AloTech was founded to remanufacture residential power meter housings for ABB. AloTech is the largest clutch manufacturer in North America. It processes 1500 to 2000 clutches per week, which includes dismantling, sorting, segregating, blasting, cleaning, machining, balancing, recycling and returning components for the customer's remanufactured assembly line.

Xerox in its UK factory returns old photocopiers to an as-new product condition. Through a series of industrial processes in

a factory environment, a discarded product is completely disassembled, and usable parts are cleaned, rebuilt and put into inventory. Then the product is reassembled from old parts to produce a unit fully equivalent to the original photo copier. **Xerox has made a large profitable business from remanufacturing.**

Ninety per cent of materials used to build Townhall Brummen are recyclable. At the end of the building's life, little material will go into the landfill, while most of the materials will be reused for other building projects.
