

COMPONENTS

OJT relays

TE Connectivity has designed a new 10A TV-8 rated OJT relay to meet market needs for high inrush capability, with-

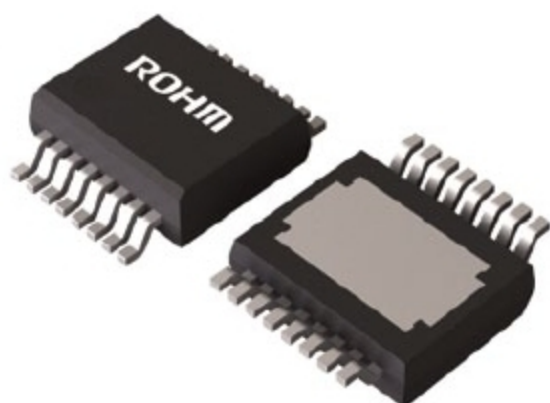

out sacrificing valuable PCB space. As product designs are becoming smaller to embed more functionality, components need to do more with less space. TE's new 10A TV-8 rated OJT power relays offer a compact and powerful design solution that can withstand up to 117A inrush current in a forty per cent smaller size compared to similarly rated relays.

Intelligent power device

ROHM recently announced the availability of BV2Hx045EFU-C, a family of high-voltage (41V) dual channel output high side switch (intelligent power device, or IPD) optimised for automotive ECUs in transmission control, engine control and other vehicle systems. An IPD is a semiconductor device that protects electronic circuits from breakdown (that

is, due to over-current during abnormalities). Unlike conventional fuses, an IPD as a semiconductor fuse can protect circuits without degrading or breaking down, making it possible to achieve maintenance-free systems.

Synchronous buck and low dropout regulator

Renesas Electronics has announced the industry's first single-chip synchronous buck and low dropout (LDO) regulator targeting low-power FPGAs,

DDR memory and other digital loads for spaceflight payload applications. ISL70005SEH is the only point-of-load (POL) power solution that reduces size, weight and power (SWaP) by integrating a synch buck and LDO in one monolithic IC. The device enables satellite manufacturers to reduce bill of materials (BOM) and power supply footprint for their medium Earth orbit (MEO) and geosynchronous Earth orbit (GEO) long-duration mission profiles.

Motor controller

Infineon Technologies is releasing the new IMC300 motor controller series. It combines iMOTION™ motion control engine (MCE) with an additional microcontroller (MCU) based on Arm Cortex-M0 core. IMC300 complements IMC100 series and aims at variable speed drives that require very high application

flexibility. Both families, IMC100 and IMC300, share the same implementation of the MCE 2.0 providing ready-to-use motor and, optional, PFC control.

Applying the MCE for controlling the motor, customers can focus on their system application that runs fully independently on the embedded Arm MCU.

Gaming chipsets

MediaTek has unveiled its Helio G70 and G80 mobile gaming-focused chipsets. The newest G series chipsets feature HyperEngine game technology, advanced multi-camera and unrivalled connectivity for uninterrupted gameplay. Helio G70 and G80 are aimed at new premium smartphone users and gaming enthusiasts who want high-end features at mid-tier price points.

TEST & MEASUREMENT

Spring-loaded LVDTs

NewTek Sensor Solutions introduces an extended family of spring-loaded LVDTs for highly accurate and repeatable dimensional gaging of components as part of manufacturing quality assurance systems. Available in AC- and DC-
