- Multi-touch functions in a kiosk allow multiple touch points on the screen at the same time. This flexibility allows a single user to use both hands to interact with the kiosk, or multiple kiosk users can interact with the kiosk at the same time.

These self-service machines lower the total cost of ownership throughout the lifecycle. Recent kiosks come

with HDMI/VGA connections allowing users to connect to any PC or laptop, while the integrated multi-touch technology transforms finger(s) movement(s) equivalent to the movement of the mouse, thus making any content touch-capable.

- Interactive touchscreens can be used effectively in hotels, spas and the hospitality industry to welcome and inform individual guests and customers. Using proximity sensors and face detection via cameras, personalised

information can be viewed before the customers interact with the touch-screen. Also, offerings, products and services can be highlighted to them quickly.

We not only see touch technology in science fiction movies, but also in real life across thousands of businesses that focus on customer engagement. This innovative technology has impacted businesses that enhance environmental, ergonomic and economical workflows. **EFY**
