

Growth Of Edge And Cloud Computing In Business

With the introduction of edge computing and cloud computing, companies have reached a different level in terms of growth and productivity. These technologies provide several benefits such as cost reduction, data analysis, enhanced security and more, which in turn has led to development of businesses all over the globe

Companies are moving their workload to cloud because of security, scalability, and flexibility. By the end of 2022, the overall market of edge computing is speculated to reach thirteen billion dollars globally as stated by Gartner. This is going to be possible because companies these days are extremely tech-savvy and are now truly understanding the advantages of cloud computing. Also, the

negative perceptions are wiping out; the majority of companies are agreeing to test their heavy workloads in the cloud and some are even moving entirely to cloud computing. By 2025, it is speculated that around seventy five per cent of data would be processed from the cloud, while the revenue of the global public cloud is expected to reach seventeen per cent by 2020, as per Gartner.
