

Should You Invest In Robotic Process Automation? Is It Worth It?

Robotic process automation (RPA) means automation of any process that is robotic or repetitive in nature. This article aims to clear any doubts about RPA and help you decide whether or not RPA is a good option for your business

Has it ever happened to you that you were copy-pasting some form of data from one place to another, or even worse, manually writing everything. And after some time, when you rechecked, you realised that you made an error earlier and had to redo everything? Or you are an employer, and when you see your employees busy wasting their time with such mundane tasks, you can't help but question if this time could be used for something better. We can agree that all such tasks are no less of an obstacle in productivity than slow Internet that makes you halt your work.

Or maybe all the things mentioned before made you nostalgic, but you are glad that you no longer have to deal with them, thanks to robotic process automation (RPA). According to US-based RPA provider Automation Anywhere, seventy per cent of firms feel that at least half of their workforce will be digital workers in a post-Covid-19 world. The survey that included nearly twenty countries had over 5,000 senior executives from mid-size and large organisations across India, the Middle East, and emerging markets in Africa and Southeast Asia.
