

Batteries From Nuclear Waste That Last Thousands Of Years

The power output of these diamond batteries is low as compared to other alternatives. However, their total longevity favours them to become critical components of future electronics manufacturing

Innovation in the area of batteries has attracted considerable attention from the scientific research community, given the need for greater energy efficiency and low-carbon techniques to supply clean power to sustain the energy evolution. With alternate, sustainable, natural, and renewable sources of energy being sought after, there is a deep interest in a nuclear-powered battery that gener-

ates electricity using nuclear waste.

A team of scientists from the University of Bristol in the UK has grown an artificial diamond in the lab. When placed in a radioactive radiation field, it generates a small electrical current. This development is expected to provide solutions for better management of nuclear waste and make clean electricity available.

The scientists hope to recycle waste
