

The Era Of Human Hybrid Electric Vehicles

Dr S.S. Verma
is professor at
Department of Physics,
Sant Longowal Institute
of Engineering and
Technology, Sangrur,
Punjab

Due to the increasing pollution being generated from diesel and petrol-based transportation modes, several companies and governments have come forward with the idea of developing and using human hybrid electric vehicles. A human hybrid electric vehicle is a system that makes use of human power in an electric vehicle

Human muscle power is reliable, almost free, and healthy to use. It helps in carrying out the daily activities with ease and comfort. Moreover, the potential of human power increases as the human population grows.

The advent of modern civilisation supported by the use of different machines

and means of transportation has made mankind to stay away from using human muscle power. Transportation is a non-separable part of any society, and it exhibits a very close relation to the style of life, range and location of activities, and goods and services that are available for consumption.

The growth in the transportation sector
