

# Truly Innovative TECH

Amongst hundreds of press releases of new products received by us, these are the ones we found worthy of the title *Truly Innovative Tech*

## Stereo A-D converter

Here's a high-performance 24-bit stereo A-D converter (ADC) with integrated acoustic activity analyser (AAA), audio buffer, and support for digital and high-SNR microphones. Launched by Asahi Kasei Microdevices Corporation (AKM), AK5706 is ideal for applications such as

smart speakers and wearable devices equipped with voice assistants and connected security devices that listen for specific sounds.

The AAA block continuously analyses incoming audio with respect to already specified criteria while the rest of the system remains powered off. This feature of the product helps in drastically reducing a product's standby power consumption and thereby extending its battery life, claims the company.

The AK5706's external trigger input allows it to wake the system based upon stimuli from sensors such as human presence detectors, door sensors, and motion detectors.

## Touchless control panel

A new innovative solution in the form of a touchless control panel has been launched by Alps Alpine. This is extremely beneficial in preventing the spread of communicable diseases in medical settings and public facilities.

Not only this, it can also lead to the replacement of switches with touch panels for a wide range of devices—

smartphones, car navigation systems, digital home appliances, security equipment, digital writing pads for ordering at a restaurant, front desk operations at public facilities, and recording clinical notes by medical professionals.

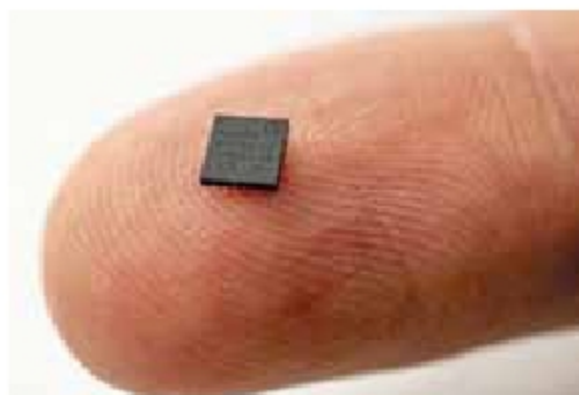

The company claims that this new touchless control panel will greatly reduce any uneasiness or aversion by providing safe and easy control.

## Piezo driver chip for haptic feedback

The recently launched BOS1211, a low-power piezoelectric driver integrated circuit (IC), enables high-definition (HD) haptic feedback in automotive human-machine interfaces (HMIs), such as automotive infotainment screens and safety alerts in touch-sensitive steering wheels.

It fulfils the growing demand for clear tactile feedback in automotive environments. Launched by Boréas Technologies, it is a high-voltage, low-power piezo driver IC that is based on CapDrive technology.

CapDrive delivers greater energy efficiency, low heat dissipation, and rapid response times, making chips ideal for devices in which size, power, responsiveness, and thermal management are essential.

## Tantalum microchip capacitor

A low-profile 3216-footprint tantalum capacitor has been recently launched by AVX Corporation. It can be used for a wide variety of medical applications such as hearing aids and other non-life-support devices as well as audio and

power amplifier modules, embedded electronics applications, including near field communication (NFC) systems and smart cards, and as coupling/decoupling capacitors in industrial, handheld and wearable electronics.

The company claims that the new TACmicrochip capacitors also deliver all the standard benefits of tantalum technology, including higher stability and reliability and improved temperature performance.

## Smallest Bluetooth module

LG Innotek claims to have developed the world's smallest Bluetooth module in order to advance the communication modules built for the Internet of Things (IoT).

BLE module for IoT is key in enabling data communications for IoT devices
