Enclosed power supplies

The LMxx-23Bxx series of enclosed power supplies launched by Mornsun not only meets normal operating conditions but can also be used in applications with higher requirements for input voltage, temperature, humidity, altitude, and electromagnetic

interference in the long term such as industrial control, LED, street light control, electricity, security, telecommunications, smart home, and more.

The input voltage range is as wide as 85 to 305V AC, while the power range covers 15-150W at 25mm of height. At the same time, it has the advantages of isolation voltage as high as 4000V AC, no-load power as low as 0.5W, and high-efficiency of 88 per cent, as per the product's press release.

Lightweight power supplies

Advanced Energy Industries has announced the availability of its Excelsys CS1000 fanless power supply series. With power delivery up to 1000W (with no fans), this family of highly efficient

power supplies eliminates acoustic noise, vibration, and the need for baseplate cooling,

thereby making them lightweight and ideal for use in a wide range of medical treatment applications as well as vibration-sensitive clinical, diagnostic and industrial applications.

As the newest addition to the Excelsys low-voltage power product line, the CS1000 series offers high conversion efficiencies (94 per cent) as well as a

24W bias supply voltage of 5V or 12V, according to the company.

The power supplies are available with 24-volt or 48-volt single outputs and operate off universal AC input voltage of 90 to 264V AC. The CS1000 series offers system designers a variety of features for increased performance, efficiency, and reliability for mission-critical applications.

AC-DC power supplies

The TPI 30, TPI 65, and TPI 125 from Traco Power are three AC-DC open frame power supply series providing between 30W and 125W with a 3000V AC reinforced isolation system.

According to the company, the existing TPI line

focuses on providing cost-efficient industrial power supplies in compact designs.

By extending the existing TPI range, the new series offers a peak power function, which enables them to deliver up to 130 per cent of the rated power for up to ten seconds.

Excellent efficiency of up to 93 per cent allows a compact design and an operating temperature range (natural convection) of -40 degrees Celsius to +60 degrees Celsius (TPI 30 and TPI 65) or -40 degrees Celsius to +50 degrees Celsius (TPI 125) without derating, while going up to +85 degrees Celsius with either load derating or forced cooling.

An Indian FPGA SOM

Here's an Indian FPGA system-on-module (SOM) that claims to include high-speed I/Os and interfaces that enable you to fulfil complex data integ-

rity requirements. The product's press release also promises faster throughput, reduced latency, and low power execution, thereby accelerating the develop-

ment of FPGA-based applications in industrial, aerospace, and medical domains.

This SOM has been launched by iWave Systems. It's based on the powerful Intel Arria 10 FPGA GX devices. The Arria 10 FPGA SOM is power-packed with up to 1150k logic elements and dual DDR4 RAM with 64-bit and 32-bit storage capabilities.

COMPONENTS

All-in-one communication module

Alps Alpine, in collaboration with Gohigh Data Networks Technology Co. Ltd, has launched the UMCC1 series cellular V2X all-in-one communication module that supports intelligent transportation, smart cities, and autonomous driving.

The module, compliant with 3GPP Release 14, is an all-in-one type with a standard inclusion of an application processor and V2X protocol stack, thereby reducing the burden on the host CPU for the onboard unit.

The company claims that the module will allow to speed up the development of 5G modules to further enhance product capabilities in the connectivity domain.

The UMCC1 series also has its own built-in power circuit (PMIC), facilitating system expansion of onboard units from simple to advanced functionality on a single platform.
