

Role Of Automotive Information Technology In Autonomous Vehicles

The development of self-driving vehicles with increasing safety is fast progressing and may become a reality in the near future. Technological advancements are constantly revolutionising not just the automotive industry but human transportation in general

Sciences, Apeejay Stya
University

Automotive information technology (IT) generally refers to hardware or software designed to enhance and boost the experience of driving or riding a vehicle. Generally, the objectives of automotive IT include improving the performance of automotive systems, enhancing the safety of motor vehicles, making useful data available to the operators, and providing better entertainment experience to passengers.

This is done by equipping vehicles

with various types of computers, software, sensors, cameras, and radar systems. Automotive IT helps in providing a number of innovative features in smart cars such as assisted parking, self-braking systems, collection of data for predictive maintenance of the vehicle, and assisting road maintenance agencies in carrying out timely maintenance.
