1 AI FOR SOLAR ASSET MANAGEMENT

Since the past few years, the renewable energy sector has witnessed profound growth. Among all the clean energy sources, solar energy has undoubtedly taken the world by storm. But just setting up solar equipment is not enough. Proper maintenance and management are necessary to make the most out of this long-term investment. Reducing operational costs and thereby boosting return on investment (ROI) is not an easy task for service providers or customers since challenges vary with factors like environment, regulations in an area, business model, and more.

Founded in 2015, Raycatch is a renewable energy startup that aims to make the solar energy market more efficient, accessible, and profitable through automated management and optimisation of solar assets. In this direction, the startup has developed a hassle-free, user-friendly, and platform-agnostic digital asset management system called DeepSolar for solar photovoltaic (PV) plants.

The artificial intelligence (AI)-based innovation uses algorithms and deep learning techniques fed inside it to analyse the existing plant data, identify patterns and assign them to

the respective root cause while eliminating any data noise in the process. It is easy to integrate the system with pre-existing supervisory control and data acquisition (SCADA) and monitoring systems. Hence, all the high-volume data is available in a single consolidated dashboard. Besides being easily deployable in any plant, regardless of the size, the architecture is secure and scalable.

The system works as a high-precision diagnostics system to provide an overall view of every PV asset with a focus on the plant's true state of health and any factor that leads to deteriora-
