

Renewable Energy Has No Option But To Grow Faster

Renewable sources of energy such as solar or wind are not only clean but are also the cheapest form of power generation in most of the markets. Increased use of these sources reduce the overall greenhouse gas emissions and have a better impact on the health of living beings. However, several challenges need to be addressed before shifting completely towards the use of the renewable sources of energy

Nijhum Rudra

The future of mankind and industry is now dependent on renewable energy, which is also good for the environment and the society. The world is focused on increased use of clean energy sources and is already undertaking various steps to promote clean and green renewable sources of energy to meet their power needs.

It is said that renewable energy can supply two-thirds of the total global energy demand and contribute to the reduction of greenhouse gas emissions that is required to limit average global surface temperature increase below two degrees Celsius.

Carbon emissions have escalated over the past few decades as society has utilised a high amount of traditional forms of

energy that is generated from fossil fuels. Renewable energy or green energy plays an imperative role in reducing the world's carbon emissions, and it is now very high on the international agenda. Most importantly, renewable energies and renewable technologies are not only clean, these are also the cheapest form of power generation in most of the markets.

Meanwhile, the growing digital world, smart devices, and smart grids have become a boon to people because these have opened the door to the market. For instance, households equipped with rooftop solar systems can feed any surplus electricity they generate into the grid, thereby acting as both producers and consumers of energy.

Other households are using smart meters to adjust their consumption in line with the current market price or time of the day. As per International Renewable Energy Agency (IRENA), renewable energy needs to be scaled up at least six times faster for the world to meet the goals set out in the Paris agreement.

Amod Anand, co-founder, Loom Solar, says, "The decline in renewable energy costs, improved energy efficiency, new technologies, and well-informed policy-making can definitely create a sustainable energy future within reach. Certainly, there are obstacles in reaching the benchmark. Global warming is a huge concern for environmentalists and leaders of the world currently. Most renewable energy sources produce little to no global warming emissions. Increasing the supply of renewable energy also allows replacing carbon-intensive energy sources and
