

sensor, which provides good low-light pixel performance for mainstream, high-volume security cameras requiring 1080p resolution.

It offers best-in-class low-light capture via a 2.8-micron pixel built on the OmniPixel 3-HS architecture, featuring high quantum efficiency and optimal signal-to-noise ratio (SNR). Compared to the company's prior-generation mainstream security sensor, the current product has sixty per cent better SNR1 and forty per cent lower power consumption.

Ambient light sensor

AMS, a supplier of high-performance sensor solutions, has claimed to launch a small integrated ambient light sensor (ALS) and proximity detection module that will enable mid-range mobile handset OEMs to develop mobile devices with

virtually bezel-less displays.

The TMD2755 provides a complete integrated 3-in-1 sensor solution, reducing board space requirements, and enabling a best-in-class low-profile system design. It combines a low-power vertical-cavity surface-emitting laser (VCSEL) emitter (with integrated, factory calibrated driver), an IR photodetector, and an ambient light sensor in a narrow footprint and low profile 0.6mm height package.

The TMD2755 is ideally suited for smartphones where the gap between the display and edge of the phone is less than 1mm.

MISCELLANEOUS

Development Kit

MadMachine, a community of developers focusing on the usage of Swift language on microcontrollers has

launched SwiftIO, a circuit board that utilises Swift programming language for running various kinds of electronics projects.

SwiftIO works by sensing the environment to receive inputs from many sensors and subsequently affecting its surroundings by controlling lights, motors, and other actuators.

The Swift framework and MadMachine IDE allow ease of writing the Swift code and downloading it on the board. It runs on macOS X, Windows, and Linux. Despite many boards out there for electronics hobbyists (such as Arduino and Raspberry Pi), SwiftIO promises equivalent simplicity and power.
