SOWFA

Visit: <https://github.com/NREL/SOWFA>

Full version: Free

Simulator for Wind Farm Applications (SOWFA) by the National Renewable Energy Laboratory (NREL) is an open source software package and framework that employs computational fluid dynamics and enables users to analyse the effects of turbulence, atmospheric patterns, and varied terrain on the performance of wind turbines and power plants. It also features a super controller for simulating multi-turbine and coordinated control of wind plants. This helps researchers and designers to minimise interference and other dynamics that may decrease plant performance.

Aurora Solar

Visit: <https://www.aurorasolar.com>

Full version: Paid; free trial

Aurora Solar is an all-in-one software that includes design and financial analysis tools for commercial and industrial projects. The generation and export of single line and layout diagrams enable easy integration into the processes. Users can calculate financial returns for loans, leases, PPAs, and cash payments. Other features include energy production estimates, generation of bankable shade reports, calculation of depreciation tax shield, customisable templates, net-metering financial analysis, among others. Remote site analysis and unified information help in saving time.

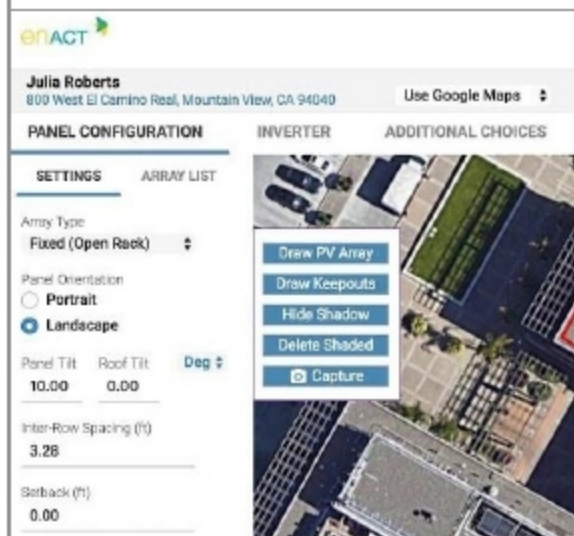

Enact

Visit: <https://enact-systems.com>

Full version: Paid

Enact is a cloud software that acts as a business platform for retail, hospitality, logistics, and industrial segments and helps in solar project management through design, financing, installation management, and asset management. Users can develop detailed cost analysis for projects, energy savings analysis, customised proposal and contract documents, calculate investment vs ROI, and more. Workflow management module enables monitoring of project sales and execution, configuration of multiple workflows, and the like. Enact engage module allows users to track financial and operational asset performance.

The Solar Labs

Visit: <https://thesolarlabs.com>; **Full version:** Paid; free trial

The Solar Labs is a cloud-based software for creating optimised PV system design with 3D visualisations and data-based sales quotations that cater to solar installers and government bodies. Features include shading analysis, 3D modelling portal, simulation of power generation, estimating bill of materials (BOM), heat map generation, panel layout automation, solar access of project location on a map, performing financial analysis, among others. This ensures better design workflow via a unified process and remote teamwork, thereby reducing costs, growing sales, and saving time.
